

# DIABETES MEDICATIONS THAT CAUSE INCONTINENCE

## SGLT-2 INHIBITORS

Work by pushing glucose into the urine to be voided before it is taken up again by the kidneys.

**Names:** Farxiga, Jardiance, Invokana, Steglatro, Brenzavvy

### EFFECT:

- Increased urge to urinate
- Frequent urination
- Nocturia
- UTIs
- Yeast infections

## METFORMIN

Works by helping to stop glucose that is stored in the liver from being released into the bloodstream and improves the body's response to insulin.

**Names:** Metformin, Metformin Extended Release, Glucophage, Glumetza, Fortamet

### EFFECT:

- Explosive diarrhea

## OTHER MEDICATIONS

Some diabetes medications are a combination of SGLT-2 and Metformin which can cause explosive diarrhea, frequent urination, frequent urges to urinate, and infections.

**Names:** Invokamet, Xigduo, Synjardy

### EFFECT:

- Explosive diarrhea
- Increased urge to urinate
- Frequent urination
